

## *Give your tree some love!*

1. **Make a fresh cut.** Slice the last 2cm off the stem, this will allow your tree to drink water when it's resting. (We normally do this, however the tree must be placed in water within 2 hours of cutting.)
2. **Don't shock your tree.** Like people, trees need to acclimatise to new environments. Trees should ideally sit in a bucket of water for 24 hours before decoration.
3. **Water your tree regularly.** Some trees drink faster than others. Check daily and do not allow the water level to drop below the fresh cut because it will reseal, unable to drink. It is not unusual for a tree to drink 2 pints of water the first day it is in the stand.
4. **Pick a spot** away from any draft or direct heat.... When you're not around, turn the tree lights off and give it some much needed rest.
